

Once a melanoma forms on your body, the cancerous cells divide and spread much faster than normal cells.

As time goes on, the cells continue to divide and multiply quickly.

The faster the cells divide, the larger the melanoma grows.

More than 1,500 Australians die from melanoma and over 12,500 new cases are diagnosed each year.

The single key to your survival?

Get them early before they spread.

Melanoma Institute Australia.
